

## **Swimming Pool & High Moisture Environment**

The principle recommendation for a Fellert application in a swimming pool and/or high moisture environment is to ensure that the relative air humidity content does not exceed 70% and the finish does not come into contact with the pool water or other direct source of water.

The gypsum wallboard substrate must be constructed in accordance with local building codes. Do not use Fellert “spring washers” or other permanent mechanical fasteners in the installation of the Fellert system—only use the Fellert adhesive.
